30 dec 2022 convection process by which heat is transferred by movement of a heated fluid such as air or water natural convection results from the tendency of most fluids to expand when heated i e to become less dense and to rise as a result of the increased buoyancy circulation caused by this effect accounts for the uniform heating of water in a kettle or air in a heated convection noun con vec tion kən 'vek shən 1 the action or process of conveying 2 a movement in a gas or liquid in which the warmer parts move up and the cooler parts move down convection currents b the transfer of heat by convection foods cooked by convection compare conduction radiation convectional kən 'vek shnəl shə nəl adjective convection is the transfer of internal energy into or out of an object by the physical movement of a surrounding fluid that transfers the internal energy along with its mass although the heat is initially transferred between the object and the fluid by conduction the bulk transfer of energy comes from the motion of the fluid convection or convective heat transfer is the transfer of heat from one place to another due to the movement of fluid although often discussed as a distinct method of heat transfer convective heat transfer involves the combined processes of conduction heat diffusion and advection heat transfer by bulk fluid flow convection is usually the dominant form of heat transfer in liquids heat energy can flow by conduction convection or radiation it always

flows from a region of high temperature to a region of low temperature i e from hot to cold conduction metals are good convection works by areas of a liquid or gas heating or cooling greater than their surroundings causing differences in temperature these temperature differences then cause the areas to move as convection is the process of heat transfer in fluids by the actual motion of matter it happens in liquids and gases it may be natural or forced it involves a bulk transfer of portions of the fluid how is heat transferred through convection when a fluid is heated from below thermal expansion takes place 22 may 2019 in general convection is either the mass transfer or the heat transfer due to bulk movement of molecules within fluids such as gases and liquids although liquids and gases are generally not very good conductors of heat they can transfer heat quite rapidly by convection convection takes place through advection diffusion or both convection cannot take place in convection occurs when particles with a lot of heat energy in a liquid or gas move and take the place of particles with less heat energy convection in a liquid convection in a liquid can be convection is single or multiphase fluid flow that occurs spontaneously due to the combined effects of material property heterogeneity and body forces on a fluid most commonly density and gravity see buoyancy when the cause of the convection is unspecified convection due to the effects of thermal expansion and buoyancy can be assumed
